Mary Cris Tapic

Storm restoration operations · Case study

From storm map to insurance claim.

A storm restoration business runs on three things: finding the damaged homes, keeping every job's records straight, and documenting the damage well enough to settle the claim. I supported all three for the owner and his business partner.

My role
Field and claims operations support

Tools
SalesRabbit, Leap, CompanyCam, Trello, Drive

Period
2021–2026, one storm restoration business

Three stages, one business

1 · FIND THE HOMES

SalesRabbit

Back-office support for the canvasser: storm territories, leads and quick fixes

2 · RUN THE JOB

Leap

Customer and job records, tasks, files and follow-ups from sales through production

3 · PROVE THE DAMAGE

CompanyCam

Job photos annotated and organized into claim documentation

Leap and CompanyCam were connected, so job photos lined up with job records. SalesRabbit ran separately for canvassing.

STAGE 1 · SALESRABBIT

The canvasser knocks. I handle the rest.

SalesRabbit is the door-to-door canvassing app the field relies on. From the back office, I made sure the canvasser always had a strong area, clean leads, and a working app.

Pointed him to the best areas

Mapped a hail swath into color-coded territories (core impact zones and a fringe zone) and assigned them to him. Used DataGrid AI to prioritize the highest-scoring neighborhoods.

Kept the leads moving

Followed up on leads and updated their statuses. Set up custom lead statuses from new to installed, and archived old leads so they stayed available.

Fixed problems as they came up

Troubleshot issues as soon as he hit them in the field, from old filters to message routing. Logged each open issue in Trello and filed bug reports with support.

Kept him field-ready

Got appointments syncing to his calendar with a workaround he confirmed was working, and wrote a tablet navigation guide for storm canvassing.

STAGES 2 AND 3 · LEAP AND COMPANYCAM

Records and photos that hold up

Photos uploaded to the job in CompanyCam → Organized by job and property → Annotated to the claim photo process → Built into reports in Slides and Sheets → **Used to settle property claims**

In Leap

Entered and maintained customer and job data from sales through production, filed documents to each customer's folder, and worked the daily queue: completed assigned tasks or asked when unclear, and monitored email, messages and proposals.

In CompanyCam

Trained on the owner's claim photo process, then annotated and organized job photos and updated claim photo uploads across storm jobs.

IN THE CLIENT'S WORDS

> *"Mary Cris annotated and organized construction photographs for evidentiary documents used in the settlement of property and casualty claims."*

Truett Harris

Business partner of the owner I supported · written reference, 2024

What changed

- Canvassing was organized around the storm’s core impact zones, not random streets.
- SalesRabbit appointments reached the owner’s calendar again.
- Customer and job records stayed current from sales through production.
- Claim photos were documented well enough to be used in settling property claims.

All names and figures are illustrative. No customer, claim or account information is shown.
